Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FEATURE:
NAME/KEY: MISC_FEATURE
LOCATION: (1)...(384)
OTHER INFORMATION: SEQ ID NO 3 is the peptide sequence of hSPHK1 in Fig. 3, corresponters in INFORMATION: adding to amino acid residue 1 to 384 of Homo sapiens SPHK-1 of GeOTHER INFORMATION: name sequence Accession Number AAF73423.
FUBLICATION INFORMATION:
AUTHORS: Nava et al.
TITLE: Functional characterization of human spingosine kinase-1
                                                                                                                                             APPLICANT: Spiegel. Sarah
TITLE OF INVENTION: Sphingosin Kinase, Cloning, Expression and Methods of Use
FILE REPERENCE: 07320001aa (2033957-0001)
CURRENT APPLICATION NUMBER: US/09/796,487
CURRENT FILING DATE: 2001-03-02

Novel sphingosine kinase protein and nucleic acid molecules for diagnosis, prophylaxis and treatment of rheumatoid arthritis, asthma, atherosclerosis, inflammation, meningitis, multiple sclerosis and septic

Claim 9; Fig 7a; 100pp; English.

This represents a human sphingosine kinase (SK) protein. The human SK protein, encoding nucleic acids and modulators are useful for modulating expression, functional activity or cellular functional activity of sphingosine kinase in a subject and also for treating a mammal by modulating the activity of SK. Diseases treated by regulating SK cellular activity include rheumatoid arthritis, asthma, atherosclerosis, inflammation, meningitis, multiple sclerosis and septic shock

```

```
The invention relates to modulating sphingosine kinase (SK) functional activity. The method involves contacting the SK with an agent for a time and under conditions to modulate phosphorylation of the SK where inducing or agonizing the phosphorylation of the SK activity and inhibiting or antagonizing the phosphorylation down regulates SK activity. The modulation of the phosphorylation is modulation of proline-directed protein kinase catalyzed phosphorylation. The proline-directed frinase is ERK1, ERK2 or CDK2. The modulation is preferably down-regulation. The methods and agents are useful for treating and/or prophylaxis, of a condition characterized by aberrant, unwanted or inappropriate cellular activity or sphingosine kinase functional activity, e.g. a meoplastic condition or an inflammatory condition such as rheumatoid arthritis, atherosclerosis, asthma, autoimmune disease or inflammatory bowel disease. The present sequence represents a human SK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RELVRSEELGRWDALVVWSGDGLMHEVVNGLMERPDWETAIOKPLCSLPAGSGNALAASL 120

The present sequence represents a human regulator of intracellular phosphorylation (HRIP). HRIP is useful for screening agonists and anteaponists and attagonists or anteagonist or anteagonist or screening adjaces or condition associated with decreased or increased expression of functional HRIP. Diseases treated or diagnosed include neurological disorders such as stroke, Parkinson's disease, accertization of viral meniagitis and other developmental disorders of the central nervous system, neuromuscular disorders, myasthenia gravis, cell proliferative disorders such as actinic keratosis, arteriosclerosis, atherosclerosis and cancer including leukammia, melanoma, myeloma and cancer of the adrenal gland, bladder, bone, bone marrow, liver, lung, muscle, ovary, autoimmune/ inflammatory disorder such as Addison's disease, acquired immunodeficiency diseases, allegies, bronchitis, diabetes mellitus, rheumatoid arthritis, microbial Novel human intracellular phosphorylation regulator polypeptides and polymucleotides for diagnosis, prevention and treatment of neurological, cell proliferative and autoimmune/inflammatory disorders. Claim 1; Page 77-78; 96pp; English infection and trauma

```
complementary strand of a polynucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence, where the oligonucleotide which comprises a 3'-end sequence, where the oligonucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence 53'-end sequence 53'-end sequence 53'-end sequence 63'-end 64-end 6
          Where a primer set comprises:
          length cDNAs defined in the specification.

The hskl gene is located on chromosome 17q25.2. The skl converts the substrate sphingosine to sphingosine-1-phosphate (SIP). The skl gene and encoded polypeptide are applicable in screening drug candidates particularly inhibitors for preventing or treating disorders such as haemostasis, haematopoisis, allergic reactions, proliferative diseases including cancer, haematopoisters such as Proliferative diseases including cancer, haematopoisters such as Beukaemia, cardiovascular diseases such as stroke, atherosclerosis and coronary artery disease, dyslipidaemia, diabetee including type I and type II diabetes, autoimmune and inflammatory diseases such as multiple sclerosis, Thelper-1 related diseases, chronic obstructive pulmonary disease, asthma, myocardial infarction, neurodegenerative disorders, natural wound healing processes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human sphingosine kinase type I gene for screening drug candidates particularly inhibitors used for preventing or treating e.g. atherosclerosis, thrombosis, asthma and diabetes.

formation in an animal. The method of the invention involves administering sphingosine kinase to the animal. The method is useful for inducing blood vessel formation in an animal. The method is useful for inducing blood vessel formation in an animal. The method is useful for congestive heart failure, myocardial ischaemia, ischaemia reperfusion injury and peripheral arterial diseases in an animal, e.g. mammal (such as primate including human). The invention is also useful for treating diseases or disorders selected from coronary artery disease, peripheral vascular disease, wound healing and fracture repair, reconstructive surgery, transplantation such as islet transplants, tendon repair/sports injury, healing of ulcers, thromboangitis obliterans (Buerger's disease), periodontal tissue regeneration and radiotherapy-induced oesophagitis. The present amino acid sequence represents the human sphingosine kinase I (SPHKI) protein as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

having a tumourigenic disorder or angiogenic disorder, caused by aberrant gene expression or activity of an isolated protein, by administering a modulator. The modulator may have eytostatic, antithyroid, antitidabetic or ophthalmological activity. The method is useful for treating a subject having a tumourigenic or angiogenic disorder, in particular for treating cancer (for example breast cancer, colon cancer, lung cancer or prostatic cancer) and, for example, Grave's disease and diabetic retinopathy. The present sequence is the amino acid sequence of the novel isolated human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEKYRRIGEMRFTLGTFLRLAALRTYRGRLAYLPVGRVGSKTPASPVVVQQGPVDAHLVP 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wang D;

          (SPHK) DNA. Cells
The invention relates to an isolated sphingosine kinase (SPHK) DNA. Cells transformed with SPHK DNA are used to screen for agents that reduce, eliminate or promote SPHK activity. Agents that inhibit activity are useful for decreasing cell proliferation, e.g. for treating cancer, and for treating diseases associated with abnormal migration and motility of cells, e.g. restenosis or diabetic neuropathy. Agents that increase activity are used to reduce cell death. Antibodies raised against SPHK, and primers or oligonucleotides derived from the DNA are useful for diagnosis. The antibodies are also useful as therapeutic inhibitors. The present sequence represents a human sphingosine kinase 1 (hSPHK1)
                                                                                                                                                                                                                                                                                                                                                                                                                        9

Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

SEQ ID NO 722; 210pp; English Example 2;

The invention relates to a novel method for detecting soft tissue sarcome which comprises obtaining a first soft tissue sample from an individual data and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic scil sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

```
The invention relates to modulating cytokine-induced or tumour necrosis factor (TNF)-induced cellular activity. The method involves contacting the cell with an agent under conditions sufficient to modulate the interaction of sphingosine kinase with a TNF receptor-associated factor (TRAF), preferably TRAF2, where inducing the association up-regulates cellular activity, and inhibiting the association down-regulates cellular activity. The agent is useful for manufacturing a medicament for treating a mammal with a condition of aberrant, unwanted or inappropriate cytokine condulating or preventing a condition of aberrant, unwanted or inappropriate cytokine-induced or TNF-induced cellular activity, or for creating or preventing a condition of aberrant, unwanted or inappropriate cytokine-induced or TNF-induced cellular activity in a mammal, such as neoplastic condition or inflammation (e.g. rheumatoid arthritis). The present sequence represents a human sphingosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RLFLAMEKGRHMEYECPYLVYVPVVAFRLEPKDGKGMFAVDGELMVSEAVQGQXHPNYFW 360

The present sequence is that of human sphingosine kinase A (SKA), an enzyme that phosphorylates sphingosine to form sphingosine 1-phosphate. The sequence was deduced from that of a polymuclectide (see AAASOSOB) isolated from an Hela cDNA library. The invention provides polymuclectides (see AAASOSOB-10) and polypeptides can be obtained using recombinant DNA methods, and host colls containing expression vectors including SK polymuclectides are used in a claimed method of screening for compounds that inhibit or activate their analogues can be used as bioactive agents to treat inflammation or their analogues can be used as bioactive agents to treat inflammation or disease including viral, bacterial or fungal infections, allergic responses, mechanical injury associated with trauma, hereditary diseases, lymphoma or carcinoma, and other conditions with activate the genes of kidney, lung, heart, lymphoid or tissues of the nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 RELVRSEELGRWDALVVMSGDGLMHEVVNGLMERPDWETAIQKPLCSLPAGSGNALAASL 120

an animal model for bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a method for producing an animal model for bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial cobstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene, a ribosyme, a polynucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising control encoded by a marker gene; and (7) a DNA chip for testing for bronchial asthma or a chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene. (1) has respiratory and antiasthmatic activities, and can be used in gene therapy. The method is useful for resting for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present corrective bronchial asthma or chronic obstructive pulmonary disease. The present

```

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13, or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (1) a reagent (1) for esting for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3)

Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a healthy subject.

Example 11; SEQ ID NO 639; 241pp; English.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (l) a reagent (l) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (4) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (5) a naminal model for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an animal model for bronchial asthma or chronic obstructive pulmonary disease, comprising to a portion of the marker gene or an animal model for bronchial asthma or chronic obstructive pulmonary disease, comprising to a protein encoded by a marker gene; and (7) a DNA chip for testing for c spronehial asthma or a chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene; and the gene through obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene. (I) has respiratory conditional asthma or chronic obstructive pulmonary disease. The present cy sequence is used in the exemplification of the present invention.

Patent No. 6610534
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Induction of blood vessel formation through administration of
TITLE OF INVENTION: polynucleotides encoding sphingosine kinases
TITLE OF INVENTION: polynucleotides encoding sphingosine kinases
TITLE OF INVENTION: US/09/970,516
CURRENT APPLICATION NUMBER: US/09/970,516
NUMBER OF SEQ ID NOS: 6
SOFTWARE: Patentin version 3.1

US-09-949-016-139382 ; Sequence 139382, Application US/09949016 ; Patent No. 6812339

```
JAPULICANT: VENTER, J. Craig et al.

APPLICANT: VENTER, J. Craig et al.

ITILE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

ITILE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TILE OF INTERNION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

CURRENT PILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR PLING DATE: 2000-10-03

PRIOR PLING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 139382

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 3, Application US/09970516

Patent No. 6610534

GENERAL INFORMATION: GENERAL SAG

TITLE OF INVENTION: Induction of blood vessel formation through administration of TITLE OF INVENTION: polynucleotides encoding sphingosine kinases

FILE REFERENCE: 4-31617

CURRENT APPLICATION NUMBER: US/09/970,516

CURRENT FILING DATE: 2001-10-04
